1. Static library and Dynamic library

Static Linking and Static Libraries (also known as an **archive**) is the result of the linker making copy of all used library functions to the executable file. Static Linking creates larger binary files, and need more space on disk and main memory. Examples of static libraries are, **.a** files in Linux and **.lib** files in Windows.

Dynamic linking and Dynamic Libraries Dynamic Linking doesn't require the code to be copied, it is done by just placing name of the library in the binary file. The actual linking happens when the program is run, when both the binary file and the library are in memory. If multiple programs in the system link to the same dynamic link library, they all reference the library. Therefore, this library is shared by multiple programs and is called a "**shared library**". Examples of Dynamic libraries are, **.so** in Linux and **.dll** in Windows.

		advantages	disadvantages				
	Static Library	 Make the executable has fewer dependencies, has been packaged into the executable file. The link is completed in the compilation stage, and the code is loaded quickly during execution. 	 Make the executable file larger. Being a library dependent on another library will result in redundant copies because it must be packaged with the target file. Upgrade is not convenient and easy. The entire executable needs to be replaced and recompiled. 				
	Dynamic Library	1.Dynamic library can achieve resource sharing between processes, there can be only one library file.2. The upgrade procedure is simple, do not need to recompile.	 Loading during runtime will slow down the execution speed of code. Add program dependencies that must be accompanied by an executable file. 				
	BY NC SA						

1.1 Building a static library

Suppose we have written the following code:

```
// mymath.h
#ifndef __MY_MATH_H__
#define __MY_MATH_H__
float arraySum(const float *array, size_t size);
#endif
```

```
// mymath.cpp
#include <iostream>
#include "mymath.h"
float arraySum(const float *array, size_t size)
  if(array == NULL)
    std::cerr << "NULL pointer!" << std::endl;</pre>
    return 0.0f;
  float sum = 0.0f;
  for(size t i = 0; i < size; i++)
    sum += array[i];
  return sum;
```

```
// main.cpp
#include <iostream>
#include "mymath.h"
int main()
  float arr1[8]{1.f, 2.f, 3.f, 4.f, 5.f, 6.f, 7.f, 8.f};
  float * arr2 = NULL:
  float sum1 = arraySum(arr1, 8);
  float sum2 = arraySum(arr2, 8);
  std::cout << "The result1 is " << sum1 <<
std::endl:
  std::cout << "The result2 is " << sum2 <<
std::endl:
  return 0:
```

1.1 Building a static library

- In previous class we do the following:
- This will compile the "main.cpp" and "mymath.cpp" into "main"
- And then run "main"

```
|→ lab git:(main) * g++ *.cpp -o main -std=c++11
|→ lab git:(main) * ./main
NULL pointer!
The result1 is 36
The result2 is 0
```

1.1 Building a static library

- A static library is created by .o file.
- Remember to use "ar" command with arguments "-cr" when building it.
- Now we should see "libmymath.a" in the current directory

Compile the source file to the object file.

The name of **.a** must be started with "**lib**" followed by the .cpp name in which a function is defined.

```
→ lab git:(main) * g++ -c mymath.cpp

→ lab git:(main) * ls

main.cpp mymath.cpp mymath.h mymath.o

→ lab git:(main) * ar -cr libmymath.a mymath.o

→ lab git:(main) * ls

libmymath.a main.cpp mymath.cpp mymath.h mymath.o
```

ar is a linux command.

c: create a static library.

r: add the object file to the static library.

1.2 Using a static library

- Now we can use ".a" static library.
- Let's compile "main" again:

"-Imymath" indicates to use "libmymath.a" or "libmymath.so"

"-L." indicates to find a library file in the current directory.

The 3 methods are equivalent.

- -L: indicates the directory of libraries
- -I: indicates the library name, the compiler can give the "lib" prefix to the library name and follows with .a as extension name.

1.2 Using a static library

If the static library is removed, the program can run normally.

remove the static library file.

To create a static library from multiple object files:

ar -cr libtest.a test1.0 test2.0

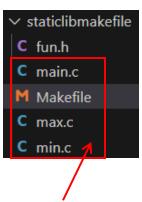

1.3 Static library in makefile

gcc -c max.c
gcc -c min.c

ar cr libfun.a max.o min.o

All the files are in the same folder.

```
#makefile with static library
                               three targets
      .PHONY:liba testliba clean
                         the first target with
      liba: libfun.a
                         its prerequisite
      libfun.a: max.o min.o
          ar cr $@ max.o min.o
      max.o : max.c
          gcc -c max.c
     min.o : min.c
          gcc -c min.c
11
                         the second target
12
                         with its prerequisite
13
      testliba: main.out
14
      main.out : main.c
          gcc main.c -L. -lfun -o main.out
16
                 the third target with no
     clean:
                 prerequisite
          rm -f *.o *.a
maydlee@LAPTOP-U1MO0N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefile$ make
```

By default, the first target can run with only make command.

The target name followed make command can run the target.

maydlee@LAPTOP-U1MO@N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefile\$ make testliba
gcc main.c -L. -lfun -o main.out

This time we put the functions in the "lib_a" folder, and create a makefile in this folder.

The first step, creates a static library file with these two .o files in the current makefile.

```
# makefile with all the .c files created static library
    OBJ = $(patsubst %.c, %.o, $(wildcard ./*.c))
    TARGET = libmyfun.a
    CC = gcc
    $(TARGET): $(OBJ)
        ar -r $(TARGET) $^
    %.o : %.c
10
        $(CC) -c $^ -o $@
12
    clean:
        rm -f *.o $(TARGET)
```

```
maydlee@LAPTOP-U1MO0N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ cd lib_a
maydlee@LAPTOP-U1MO0N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles/lib_a$ make
gcc -c min.c -o min.o
gcc -c max.c -o max.o
ar -r libmyfun.a min.o max.o
ar: creating libmyfun.a
maydlee@LAPTOP-U1MO0N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles/lib_a$ ls
libmyfun.a makefile max.c max.o min.c min.o
```

```
✓ staticlibmakefiles
✓ lib_a
M makefile
C max.c
C min.c
C fun.h
C main.c
M Makefile
```

The second step, creates another makefile in the upper-level folder to link the static library into the executable file.

```
#link with static library in makefile
    OBJS = $(patsubst %.c, %.o, $(wildcard ./*.c))
    TARGET = main
    CC = gcc
     LDFLAGE = -L./lib_a
     LIB = -lmyfun
    $(TARGET): $(OBJS)
10
        $(CC) $^ -o $@ $(LIB) $(LDFLAGE) <
11
13
    %.o: %.c
        $(CC) -c $^ -o $@
14
     clean:
         rm -f *.o $(TARGET)
```

Links the executable file with the static library.

```
maydlee@LAPTOP-U1MO@N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles/lib_a$ cd ..
maydlee@LAPTOP-U1MO@N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ make
gcc -c main.c -o main.o
gcc main.o -L./lib_a -lmyfun -o main
maydlee@LAPTOP-U1MO@N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ ./main
Please input two integers:4 9
maxNum = 9, minNum = 4
```

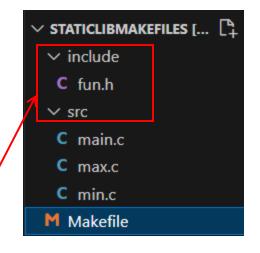

```
#link with static library in makefile
    OBJS = $(patsubst %.c, %.o, $(wildcard ./*.c))
     TARGET = main
     CC = gcc
     LDFLAGE = -L./lib a
     LIB = -lmyfun
    $(TARGET): $(OBJS)
10
                 $(LIB) $(LDFLAGE) $^ -o $@
11
        $(CC)
12
13
     %.o : %.c
14
        $(CC) -c $^ -o $@
15
16
     clean:
         rm -f *.o $(TARGET)
17
```

If you put the flag before \$^, it will cause error.

```
maydlee@LAPTOP-U1MO0N2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ make
gcc -lmyfun -L./lib_a main.o -o main
/usr/bin/ld: main.o: in function `main':
main.c:(.text+0x53): undefined reference to `max'
/usr/bin/ld: main.c:(.text+0x65): undefined reference to `min'
collect2: error: ld returned 1 exit status
make: *** [Makefile:11: main] Error 1
```

This time we put all the source files in the "src" folder, the function header file in the "include" folder, and create a makefile in the current folder. (Only one makefile)

```
lib_srcs := $(filter-out src/main.c, $(wildcard src/*.c))
lib_objs := $(patsubst %.c, %.o, $(lib_srcs))
include_path := ./include
I_options := $(include_path:%=-I%)
lib/%.o : src/%.c
    mkdir -p $(dir $@)
    gcc -c $^ -o $@ $(I_options)
lib/libmath.a : $(lib_objs)
                                                               The first part of the
    mkdir -p $(dir $@)
                                                               makefile just
    ar -r $@ $^
                                                               creates a static
                                                               library named
static_lib : lib/libmath.a
                                                               libmath.a
clean:
    rm -rf ./lib
.PHONY : clean static_lib
```

```
maydlee@LAPTOP-U1MOØN2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ make
ar: creating lib/libmath.a
maydlee@LAPTOP-U1MOØN2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$ ls ./lib
libmath.a
maydlee@LAPTOP-U1MOØN2F:/mnt/d/mycode/CcodeVS/staticlib/staticlibmakefiles$
```

```
#====== Linking static library=======
library path := ./lib
linking libs := math
l options := $(linking libs:%=-1%)
L_options := $(library_path:%=-L%)
linking_flags := $(l_options) $(L_options)
objs/main.o : src/main.c
    mkdir -p $(dir $@)
    gcc -c $^ -o $@ $(I_options)
objs/test : objs/main.o
    mkdir -p $(dir $@)
    gcc $^ -o $@ $(linking flags)
run : objs/test
    ./$<
clean :
    rm -rf ./lib ./objs
.PHONY : clean static lib run
```

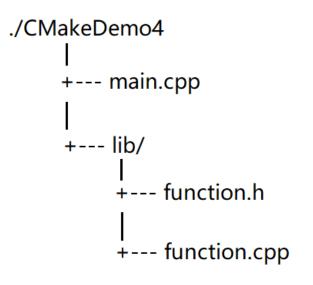

The second part of the makefile links the static library **libmath.a** to the executable file **test** in the "objs" folder.

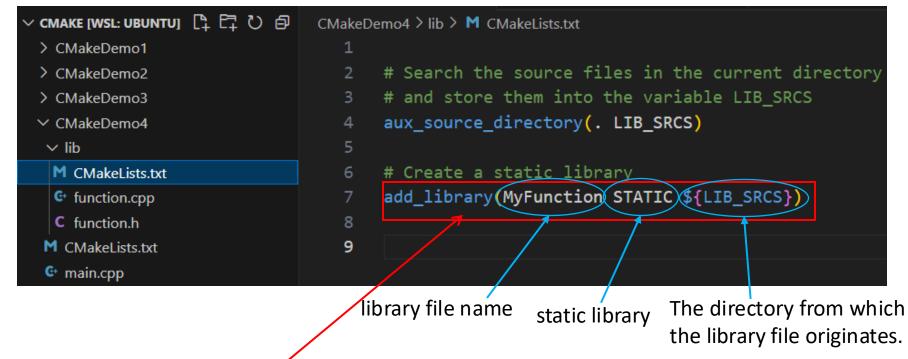

1.4 Creating and linking a static library by CMake

We want to create a static(or dynamic) library by function.cpp and call the static library in main.cpp. This time we write two CMakeLists.txt files, one in **CmakeDemo4** folder and another in **lib** folder.

The CMakeLists.txt in **lib** folder creates a static library.

Create a static library named **libMyFunction.a** by the files in the current directory.

The CMakeLists.txt in **CMakeDemo4** folder creates the project.

```
∨ CMAKE [WSL: UBUNTU] [1 □ ひ 🗇
                               CMakeDemo4 > M CMakeLists.txt
                                      # CMake minimum version
 > CMakeDemo1
 > CMakeDemo2
                                      cmake_minimum_required(VERSION 3.10)
 > CMakeDemo3
                                      # project information

∨ CMakeDemo4

                                      project(CMakeDemo4)

✓ lib

  M CMakeLists.txt
   G function.cpp
                                      # Search the source files in the current directory
   C function.h
                                      # and store them into the variable DIR SRCS
 M CMakeLists.txt
                                      aux source directory(. DIR SRCS)
  @ main.cpp
                                 10
M CMakeLists.txt
                                 11
                                      # add the directory of include
G hello.cpp
                                 12
                                      include_directories(lib)
                                 13
                                 14
                                      # add the subdirectory of lib
                                 15
                                      add_subdirectory(lib)
add subdirectory command
indicates there is a subdirectory
                                      # Specify the build target
in the project. When running the 18
                                       add executable(CMakeDemo4 ${DIR SRCS})
command, it will execute the
                                 19
CMakeLists.txt in the subdirectory
                                       # Add the static library
automatically.
                                      target_link_libraries(CMakeDemo4)MyFunction)
                                 21
```

Indicates that the project needs link a library named **MyFunction**, MyFunction can be a static library file or a dynamic library file.

project name

library file name

If there are more than one file, list them using, space as the separator.

```
maydlee@LAPTOP-U1MO0N2F:/mnt/d/CMake/CMakeDemo4$ mkdir build
maydlee@LAPTOP-U1MO0N2F:/mnt/d/CMake/CMakeDemo4$ cd build
maydlee@LAPTOP-U1MOØN2F:/mnt/d/CMake/CMakeDemo4/buildscmake ...

2. Parameters

```
#include<stdio.h>
int add1(int a,int b){
    int sum = (a++)+(b++);
    return sum;
int add2(int *x,int *y){
    int sum = ((*x)++)+((*y)++);
    return sum;
int add3(int &c,int &d){
    int sum = (c++)+(d++);
    return sum;
int main(){
    int i=0, j=0;
    scanf("%d",&i);
    scanf("%d",&j);
    printf("i_address:%p,j_address:%p\n",&i,&j);
    int sum=add1(i,j);
    printf("%d+%d=%d\n",i,j,sum);
    sum=add3(i,j);
    printf("%d+%d=%d\n",i,j,sum);
    return 0;
```

Q1. How to compile the source code on the left hand, by using gcc or g++?

Q2. Is there any compiling error on the source code, if no, compile it, if yes, correct and compile.

Q3. What's the output of this piece of code while input data is 1 and 2?

Α	В	С	D
1+2=3	1+2=3	1+2=3	1+2=3
1+2=3	2+3=5	2+3=3	2+3=5
1+2=3	2+3=5	3+4=5	3+4=7

2.1 Pass by value: fundamental type

Sing "-g" option while compiling to generate the executable file, then set break point and debug.

Q1. What's the address of variable "i" and "j"?

Q2. Is the address of variable "a" same with the address of "i"? how about "b" and "j"?

Q3. Do variables a and b still exist after returning from the "add1" to the "main"?

```

                                      printf("%d+%d=%d\n",i,j,sum);
> &i: 0x7fffffffdd9c
                                      return 0;
> &j: 0x7fffffffdda0
```

2.2 Pass by value: pointer

Wing "-g" option while compiling to generate the executable file, then set break point and debug.

- Q1. Is the value of variable "x" same with the address of "i"? how about the value of "b" and the address of "j"?
- Q2. Do variables x and y still exist after returning from the "add2" to the "main"?
- Q3. Which following piece(s) of add2 would cause segment falut, or both? Why?

```
/option A
int add2(int*x,int*y){
    int sum= ((*x)++)+((*y)++);
    return sum;
                     //option B
    free(x);
                     int add2(int*x,int*y){
    free(y);
                         int sum= ((*x)++)+((*y)++);
    x=NULL;
                         free(x);
    y=NULL;
                          free(y);
                          x=NULL;
                          y=NULL;
                         return sum;
```

```
int main(){
 &a: -var-create: unab...
                                      int i=0, j=0;
 a: -var-create: unabl...
                                      scanf("%d",&i);
 &b: -var-create: unab...

generate the executable file, then set break point and debug.

Q1. Is the address of variable "c" same with the address of "i"? how about the address of "b" and the address of "j"?

Q2. For the following code "add3_x", is the space of "e" belongs to heap or stack? What's the problem of the following code? Fix it and make the return value is 4.

```
int add3_x(int &c,int &d){
    int sum= (c++)+(d++);
    int *e= (int*)malloc(sizeof(int));
    c=*e;
    d=*e;
    *e=1;
    sum= (c++)+(d++);
    return sum;
}
```

```

Exercise 1

```
#include <iostream>
using namespace std;
int * create_array(int size)
  int arr[size];
  for(int i = 0; i < size; i++)
    arr[i] = i * 10;
  return arr;
int main()
  int len = 16;
  int *ptr = create array(len);
  for(int i = 0; i < len; i++)
    cout << ptr[i] << " ";
  return 0;
```

What compilation warnings occur when you compile the program? Why? What will happen if you ignore the warning and run the program? Fix bugs of the program and run it correctly without memory leak.

Define a function that swaps two values of integers. Write a test program to call the function and display the result.

You are required to compile the function into a static library "libswap.a", and then compile and run your program with this static library.

Exercise 3

- Run the demo code on page 21 and 22, answer the questions on these pages.
- Compare the differences between pointers and references in C++, as well as the differences between references in C++ and Python, make a summay.
